Definition IF A is an non motion, and vER", then v is an eigenvector for A with eigenvalue & if
$\Delta \mathbf{v} = \lambda \mathbf{v}$
If $Av = \lambda v$ then $Av - \lambda v = 0$ i.e. $Av - \lambda Iv = 0$ i.e. $(A - \lambda I)v = 0$ . If $Av = \lambda v$ then $Av - \lambda v = 0$ i.e. $Av - \lambda Iv = 0$ i.e. $(A - \lambda I)v = 0$ .
We should assume v to is a nonzero mill vector for A-AI. (ms an only neppen " and for each value )
How do we find eigenvalues and eigenvectors: If $Av = \lambda v$ then $Av - \lambda v = 0$ i.e. $Av - \lambda Iv = 0$ i.e. $(A - \lambda I)v = 0$ . We should assume $v \neq 0$ is a nonzero null vector for $A - \lambda I$ . This can only happen if det $(A - \lambda I) = 0$ . We should assume $v \neq 0$ is a nonzero null vector for $A - \lambda I$ . This can only happen if det $(A - \lambda I) = 0$ . This condition allows us to solve for the corresponding eigenvalue $\lambda$ . Solve for $\lambda$ ; and for each value $\lambda$ (each eigenvalue), solve $(A - \lambda I)v = 0$ for the corresponding eigenvector(s) $v$ .
For $A = \begin{bmatrix} 25 & 36 \\ -18 & 26 \end{bmatrix}$ , $A - \lambda I = \begin{bmatrix} -25 & 36 \\ -18 & 26 \end{bmatrix} - \begin{bmatrix} \lambda & 0 \\ 0 & \lambda \end{bmatrix} = \begin{bmatrix} -25 - \lambda & 36 \\ -18 & 26 - \lambda \end{bmatrix}$
$ -25-\lambda - 36  = (25-1)(55-1) + 3(518 = \lambda^2 - \lambda - 2 = (\lambda+1)(\lambda-2)$
-18 20-21 - the constant of the two roots $\lambda_1 = -1$ , $\lambda_e = 2$ (the two eigenvalues).
To find the corresponding eigenvectors V, V:
First take $\lambda_1 = -1$ and solve $AV_1 = -V_1$ i.e. $(A + I)V_1 = 0$ . $A + I = \begin{bmatrix} -24 & 36 \\ -18 & 27 \end{bmatrix} \begin{bmatrix} 3 \\ 2 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \end{bmatrix}$ (by inspection)

$\begin{bmatrix} 0 & -3x_2 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 0 \\ y \end{bmatrix}$
