Combinatorics

Book 3

Fourth method: Decompose $F(x) = \frac{1+x}{1-x-x^2}$ using partial fractions. Note: The factors Lax, 1-px reveal the reciprocal roots a, B. (The roots Factor the denominator 1-x-x2 = (1-ax)(1-px) The roots are the same as the roots of x^2+x-1 i.e. $-\frac{1\pm\sqrt{1+4}}{2} = -\frac{1\pm\sqrt{5}}{2}$ are a, B. 2 (-1 ∓ √5) The reciprocal roots are $\frac{2}{-1\pm\sqrt{5}}$ $\frac{-1\pm\sqrt{5}}{-1\pm\sqrt{5}}$ 175 $\alpha = \frac{1+\sqrt{5}}{2} \approx 1.618$ (the golden ratio) eciptocal nois $\alpha + \beta = 1$ $\alpha_{-\beta} = \sqrt{5}$ $\beta = \frac{1 - \sqrt{5}}{2} \approx -0.618$ 1+1-1=0 as = -! Always use a, s in the algebraic simplification $1+\alpha-\nu^2=0$ $\alpha^2 = \alpha + 1$ $\beta^2 = \beta + 1$ $A \sum_{n=0}^{\infty} (\alpha x)^n + B \sum_{n=0}^{\infty} (\beta x)^n$ $F(x) = \frac{1+x}{1-x-x^2} = \frac{1+x}{(1-\alpha_x)(1-\beta_x)}$ $\frac{A}{1-\kappa_T} + \frac{B}{1-\beta_T}$ $\sum_{n=0}^{\infty} (A\alpha^{n} + B\beta^{n}) x^{n}$ n ~ Aa" (exponential growth rate)

Use partial fractions to find A, B such that $\frac{1+x}{1-x-x^2} = \frac{1+x}{(1-\alpha x)(1-\beta x)} = \frac{A}{1-\alpha x} + \frac{B}{1-\beta x}$	$\kappa^{2} = \kappa + 1$ $\beta^{2} = \beta + 1$
$1+x = A(1-\beta x) + B(3-\alpha x) \qquad \text{Evaluate at } x = \frac{1}{\alpha}, \text{ then}$ $1+\frac{1}{\alpha} = A(1-\frac{\beta}{x}) \qquad 1+\frac{1}{\beta} = B(1-\frac{\beta}{\beta})$ $\alpha^{2} = \alpha + 1 = A(\alpha-\beta) = \sqrt{5}A \implies A = \frac{\alpha^{2}}{\sqrt{5}} \qquad B = -\frac{\beta^{2}}{\sqrt{5}}$	at f. a ← β in the changed by algebraic conjugation
$q_{a} = A_{k} + B_{\beta}^{n} = \frac{w^{2}}{\sqrt{5}} \alpha^{n} - \frac{\beta^{2}}{\sqrt{5}} \beta^{n} = \frac{\alpha^{n+2} - \beta^{n+2}}{\sqrt{5}} = \frac{\left(\frac{1+\sqrt{5}}{2}\right)^{n+2} - \left(\frac{1-\sqrt{5}}{2}\right)^{n+2}}{\sqrt{5}}$	€ ← -5
$f(s \land \to \infty, \ \beta \to 0 \text{since } \beta < 1 \text{so } q_n - A\alpha \text{where } A = \frac{1}{\sqrt{5}}$ $\frac{\text{Asymptotics}}{\text{if } f(n)} \to I. \text{This is different } f(n) \sim \alpha \text{we write } f(n) \sim g(n)$ $if \frac{f(n)}{g(n)} \to I. \text{This is different } f(n) \sim \alpha (approximately equal$	(f is <u>asymptotic</u> to g)).
eq. $\sqrt{n^2 + 10n} \rightarrow \infty$ as $n \rightarrow \infty$; $\sqrt{n^2 + 10n} \sim n$ do $n \rightarrow \infty$. Check: $\frac{\sqrt{n^2 + 10n}}{n} = \sqrt{1 + \frac{10}{11}} \rightarrow 1$. ($\lim_{n \rightarrow \infty} \sqrt{1 + \frac{10}{n}} = 1$). $\sqrt{n^2 + 10n} - n = (\sqrt{n^2 + 10n} - n) - \frac{\sqrt{n^2 + 10n}}{\sqrt{n^2 + 10n}} = \frac{10n}{\sqrt{n^2 + 10n}} = \frac{10}{\sqrt{1 + \frac{10}{11}}}$	$+1$ 5 44 $h \gg 0$

$n^{3} + 7n^{2} \sim n^{3} a_{0} n \rightarrow \infty \qquad \text{Since} \frac{n^{3} + 7n^{2}}{n^{3}} = 1 + \frac{7}{n} \rightarrow 1 \qquad a_{0} n \rightarrow \infty$ yet $\left(n^{3} + 7n^{2}\right) - n^{3} = 7n^{2} \rightarrow \infty \qquad a_{0} n \rightarrow \infty$
In our case the convergence is stronger: not only is $q_n - A\alpha^n$ but moreover $q_n - A\alpha^n \rightarrow 0$. We can actually evaluate q_n by taking the closest integer to $A\alpha^n$. $\frac{1}{1-\mu} = 1+\mu + \mu^2 + \mu^3 + \cdots$
Another example of partial fraction decomposition: 1+2x-3x ² 1+2x-3x ² 1+2x-3x ² A B C
$\frac{1+x+4x^2+4x^3}{(1+x)(1+4x^2)} = \frac{1}{(1+x)(1+2ix)(1-2ix)} = \frac{1}{(1+x)(1+2ix)(1-2i$
$\frac{\partial R}{\partial r} = 0 \qquad n = 0 \qquad n = 0 \qquad n = 0 \qquad n = 0 \qquad q_{m} \qquad q_$
$q_n \sim c 2^n$. From Maple it seems $q_n \sim \frac{1}{10} 2^n$. $kook again: \qquad q_n \sim \begin{pmatrix} \frac{q}{5} \cdot 2^n & \text{if } n \equiv 0 \mod 4; \\ \frac{1}{10} 2^n & \text{if } n \equiv 1 \mod 4; \\ -\frac{q}{3} \cdot 2^n & \text{if } n \equiv 2 \mod 4; \\ -\frac{1}{10} \cdot 2^n & \text{if } n \equiv 3 \mod$
