The background of the image is a vibrant, abstract geometric pattern composed of numerous triangles in various colors, including shades of blue, green, yellow, orange, red, purple, and pink. These triangles are arranged in a way that creates a sense of depth and perspective, resembling a stylized landscape or a complex crystal structure.

# Algebraic Topology

A solid yellow rectangular box is positioned in the lower right quadrant of the image. It contains the text "Book 2" in a large, black, sans-serif font.

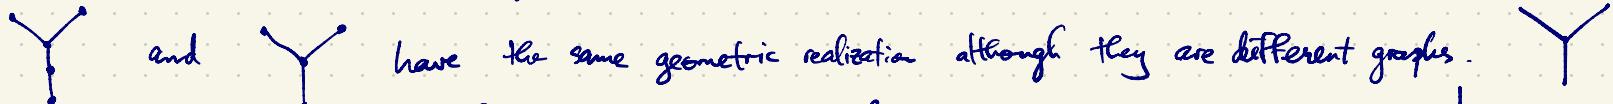

Book 2

When are two covering maps of  $X$  equivalent? Say  $Y \xrightarrow{f} X$ ,  $Y' \xrightarrow{f'} X$  are covering maps.

Graph i.e. combinatorial graph with vertices  $\{1, 2, 3, 4\}$   
and edges  $\{\{1, 2\}, \{1, 3\}, \dots, \{3, 4\}\}$ .

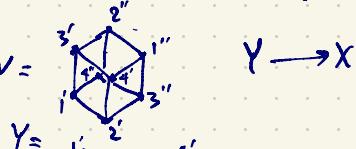

$X$  is the geometric realization of this graph formed as a disjoint union of copies of  $[0, 1]$  with endpoints identified as required by the picture.

A homomorphism of graphs  $\Gamma \xrightarrow{f} \Gamma'$  is a map  $V(\Gamma) \xrightarrow{f} V(\Gamma')$  preserving adjacency  
i.e.  $x \sim y$  in  $\Gamma \Rightarrow f(x) \sim f(y)$  in  $\Gamma'$ . A covering map of graphs is a homomorphism  
( $x, y \in V(\Gamma)$ )  
 $(x, y \in E(\Gamma))$  inducing a bijection on the neighbours of each vertex of  $\Gamma$   
(and the preimage of the neighbours of each vertex  $y \in \Gamma'$  are copies  
of the neighbours of  $y$ .)

Fig. a double cover of  $X =$

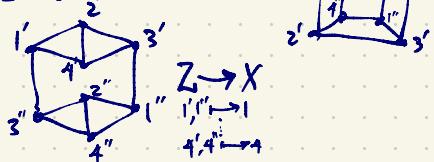

is the 1-skeleton of the cube  $Y =$

$$\begin{aligned} 1,1'' &\mapsto 1 \\ 2,2'' &\mapsto 2 \\ 3,3'' &\mapsto 3 \\ 4,4'' &\mapsto 4 \end{aligned}$$

The covering space is  $Y \xrightarrow{f} X$  (or informally just  $Y$ ).  
Some other double covers of  $X$ :

Trivial double cover

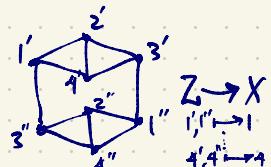

When are two covers of  $X$  equivalent (isomorphic, i.e. essentially the same) ?

Let  $p_1: X_1 \rightarrow X$ ,  $p_2: X_2 \rightarrow X$  be covering spaces of  $X$ . We say  $\theta: X_1 \rightarrow X_2$  is an equivalence or isomorphism of the two covers if  $\theta$  is a homeomorphism and  $p_2 \circ \theta = p_1$ , i.e. this diagram commutes.

$$\begin{array}{ccc} X_1 & \xrightarrow{\theta} & X_2 \\ & \downarrow \theta & \\ p_1 \searrow & & \downarrow p_2 \\ & X & \end{array}$$

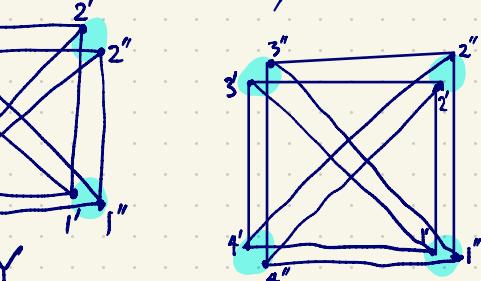

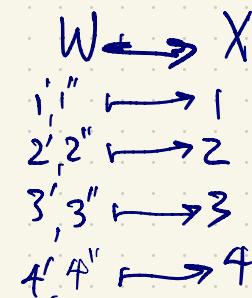

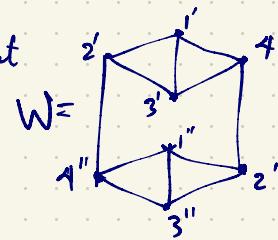

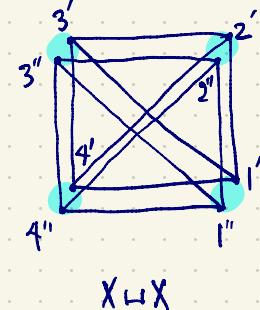

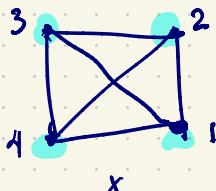

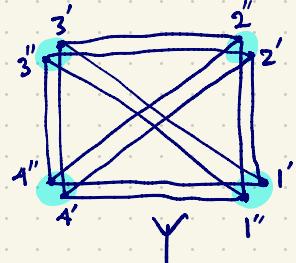

E.g.

$Z \rightarrow X$  is not equivalent to  $Y \rightarrow X$ . But what about

Is this equivalent to  $Z \rightarrow X$ ? No...

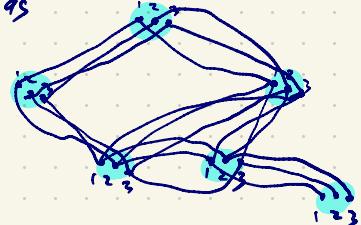

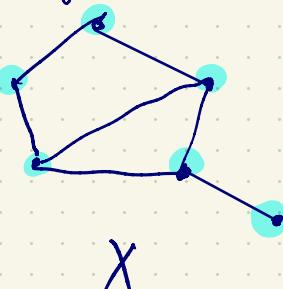

Another picture of these covers:

W

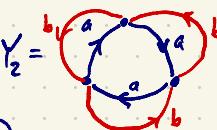

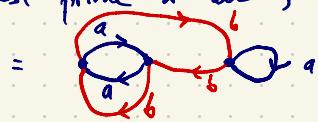

To construct an  $r$ -fold cover of  $X$ , create one copy of  $[r] = \{1, 2, \dots, r\}$  for each vertex of  $X$ . Then for each edge of  $X$ , match up the corresponding fibres in the cover using a chosen permutation.

A triple cover  $Y \rightarrow X$  is constructed as

Why is 2 more special than other positive integers (the oddest prime & all)?

Consider  $X = \begin{array}{c} \text{---} \\ | \\ \text{---} \end{array}$  has many triple covers including  $Y_1 = \begin{array}{c} \text{---} \\ | \\ \text{---} \end{array}$

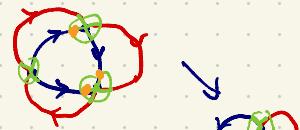

The covering maps  $Y_1 \rightarrow X$  and  $Y_2 \rightarrow X$  are not equivalent.

An equivalence between  $Y \rightarrow X$  and itself (automorphism of the cover) is a deck transformation. This is the same as a homeomorphism  $Y \rightarrow Y$  which preserves fibres.

In the example above,  $Y_2 \rightarrow X$  has 3 automorphisms (deck transformations). But  $Y_1 \rightarrow X$  has only one (trivial) deck transformation.

In a connected  $r$ -fold cover, there are at most  $r$  deck transformations. If equality holds, the covering space is normal or Galois. (not the same as normal space in point set topology). Double covers are always normal.

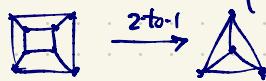

In group theory, subgroups of index 2 are normal.

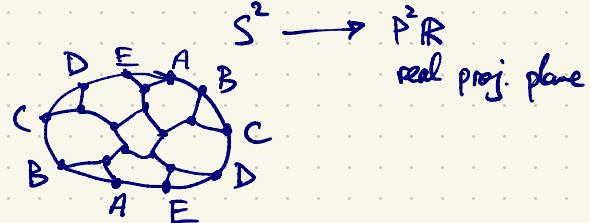

(separable)  
In the case of extensions of fields, the extension is normal.

For a field extension  $E \supseteq F$ , the degree of the extension is  $[E : F] = \text{dimension of } E \text{ as a vector space over } F$ . The number of  $F$ -automorphisms of  $E$  (i.e.  $\sigma: E \rightarrow E$  automorphism fixing  $\sigma(a) = a$  for all  $a \in F$ ) is at most  $[E : F]$ . If this number is equal, it's a normal or Galois extension. Extensions of degree 2 (quadratic extensions) are always normal.

Double covers: examples

dodecahedral graph  $\rightarrow$  Petersen

$S^n$  is not a top. group unless  $n \in \{1, 3\}$ .

$$S^1 = \{z \in \mathbb{C} : |z| = 1\}.$$

$$S^3 = \{z \in \mathbb{H} : |z| = 1\} \quad \mathbb{H} = \{a\mathbf{i} + b\mathbf{j} + c\mathbf{k} + d\mathbf{l} : a, b, c, d \in \mathbb{R}\} \quad i^2 = j^2 = k^2 = l^2 = -1$$

$$\cong \text{SU}_2(\mathbb{C}) = \left\{ A = \begin{bmatrix} \alpha & \beta \\ \gamma & \delta \end{bmatrix} : \alpha, \beta, \gamma, \delta \in \mathbb{C}, AA^* = A^*A = I, \det A = 1 \right\}$$

$$SO_3(\mathbb{R}) = \{A \in \mathbb{R}^{3 \times 3} : AA^T = A^T A = I, \det A = 1\}$$

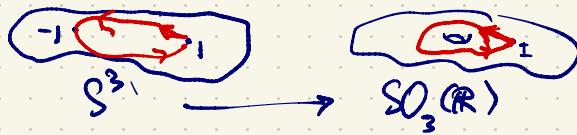

$$O_3(\mathbb{R}) = \{A \in \mathbb{R}^{3 \times 3} : AA^T = A^T A = I\}$$

has two connected components

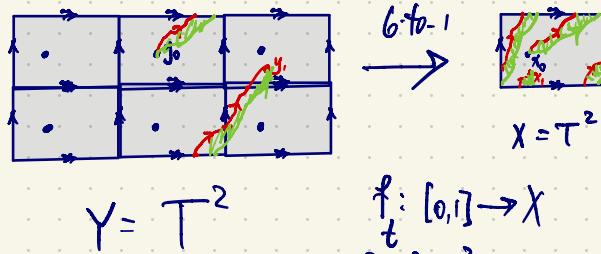

Fact:  $S^3 \cong \text{SU}_2(\mathbb{C}) \rightarrow SO_3(\mathbb{R})$  is a double cover.

$$Z(S^3) = \{\pm 1\} \quad \text{homeomorphism}$$

$$\text{PSU}_2(\mathbb{C}) = S^3 / Z(S^3) \cong SO_3(\mathbb{R}) \cong P^3 \mathbb{R}.$$

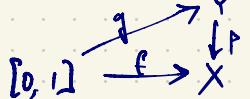

In general for  $n \geq 3$ ,  $\pi_1(\underline{SO_n(R)}) \cong \mathbb{Z}/2\mathbb{Z}$ .  
 $Spin_n(R) \rightarrow SO_n(R)$  is its universal cover; a double cover  
constructed from Clifford Algebras (generalizing H1).

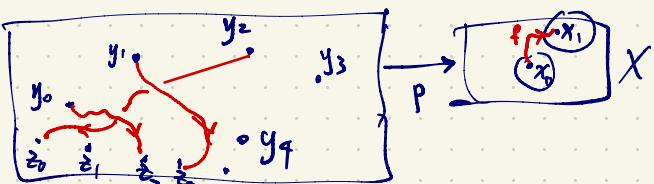

Assuming  $X$  is path-connected and  
 $p: Y \rightarrow X$  is a path-connected covering space,  
 $X = Y/\sim$  where two points  $y_0, y_1 \in Y$  satisfy  $y_0 \sim y_1$  iff  
 $p(y_0) = p(y_1)$ .

$f: [0,1] \rightarrow X$   
path in  $X$   
from  $f(0) = x_0$   
to  $f(1) = x_1$ ,  
 $f': [0,1] \rightarrow X$   
is another path in  $X$   
from  $x_0$  to  $x_1$ ,  
homotopic to  $f$

In any covering space  $p: Y \rightarrow X$  and given  
any path  $f: [0,1] \rightarrow X$  starting at  $f(0) = x_0$ ,  
the path  $f$  can be lifted to  $Y$   
i.e. there is a path  $g: [0,1] \rightarrow Y$  such  
that  $f = p \circ g$   
i.e.

and this lift is  
unique if we say which  
of the points in  $f(X)$   
to take as the starting  
point for  $g$ .

$$\bar{p}'(x_0) = \{y_0, y_1, y_2, \dots\}$$

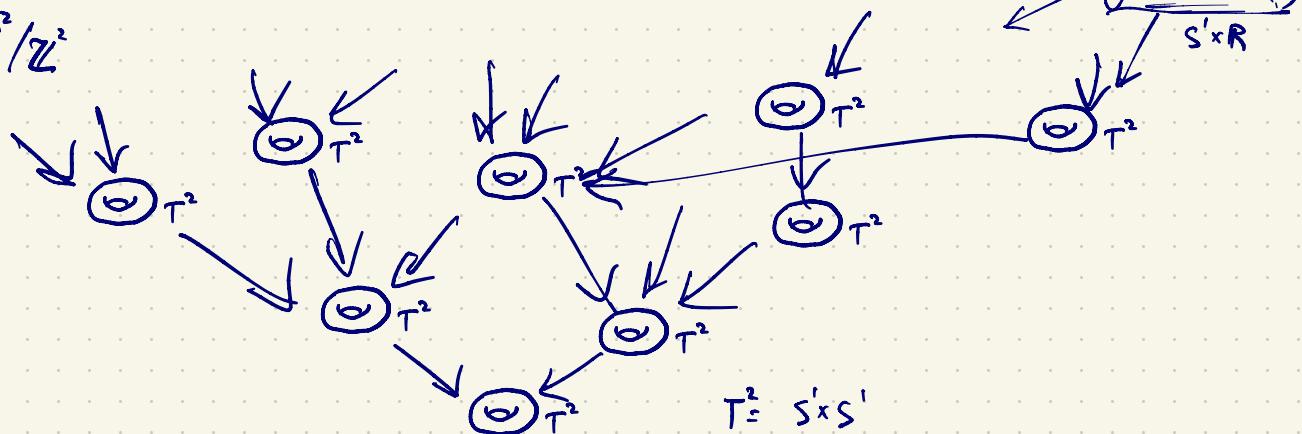

$$\bar{p}'(x_1) = \{z_0, z_1, z_2, \dots\}$$

More generally, if  $f_t$  is a homotopy in  $X$  and we are given  $f_0$ , then every lifting of  $f_0$  to  $Y$  extends to a lifting of  $f_t$  to  $Y$ .

$$\begin{array}{ccc} & \mathbb{R}^2 & \\ \swarrow & & \searrow \\ & \downarrow & \\ & Y & \end{array}$$

$\mathbb{R}^2$  is the universal cover of  $T^2$

$$\mathbb{R}^2 \xrightarrow{\pi} T^2 = \mathbb{R}^2 / \mathbb{Z}^2$$

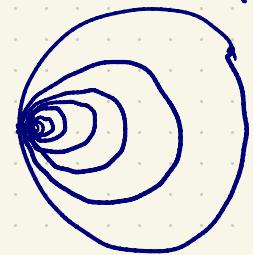

Which top. spaces have a universal cover? (equivalently a simply connected cover)

Let  $X$  be a path-connected space. Then  $X$  has a path-connected and universal cover iff  $X$  is

- path-connected
- locally path-connected
- semi-locally simply connected

Example of a top. space without a universal cover: Hawaiian earring  $\subset \mathbb{R}^2$

(not a CW complex)

Universal cover of  $K_4$

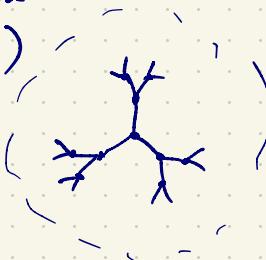

: trivalent tree

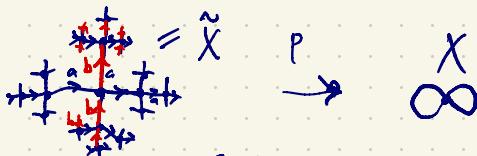

(also the universal cover  
of any trivalent connected graph)  
i.e. regular of degree 3 connected

$\neq S^1 \vee S^1 \vee S^1 \vee \dots$

countable  
wedge sum  
(CW complex)

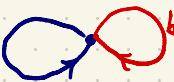

Universal cover of any connected regular graph of degree 4 is

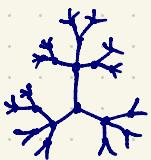

Cayley graph of  $\text{Free}\{a, b\} = G$   
Vertices correspond to elements of  $G$ .

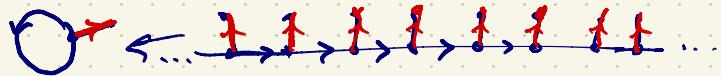

Every vertex  $w \in G$  has  
edges to  $wa, wa^{-1}, wb, wb^{-1}$ . e.g.

Universal cover of  $K_{3,4}$

$$\tilde{X} = X/G$$

$P^2 R$  has  $S^2$  as its universal cover.

$$S^2 \rightarrow P^2 R = S^2/G$$

$G = \{1, -1\}$  acts on  $S^2$

quotient of  $S^2$   
by the antipodal  
relation.

$$1x = x$$
$$(-1)x = -x \quad (\text{antipode of } x)$$

$X_{\sim} =$  partition of  $X$  into equivalence classes of the equiv. relation " $\sim$ "

$X/G =$  partition of  $X$  into the orbits of  $G$   
( $x \sim xg \text{ or } g(x)$ )  
for all  $g \in G$ .

$X \rightarrow X_{\sim}$

$$\mathbb{R}/\mathbb{Z} \cong S^1$$

$$\mathbb{R}^2/\mathbb{Z}^2 \cong T^2 = S^1 \times S^1$$

A non-discrete action of  $\mathbb{Z}$  on  $\mathbb{R}$  eg.  $\{2^k : k \in \mathbb{Z}\}$
